Life cycle of an Error/Bug

Bug Lifecycle Explanation

The bug lifecycle describes the stages a defect goes through from the moment it is discovered until it is completely resolved.

- **Error Detection:** A tester or an end-user finds unexpected behavior in the system.
- **Identified:** The bug is documented in a management platform (*Notion*), including reproduction steps, screenshots, expected behavior, and actual results.
- **Assigned:** The assigned developer analyzes the code to understand why the error is occurring and plans the fix.
- **Fixed:** The developer applies the necessary changes to the code to correct the failure.
- **Verified:** The Core QA Team tests the new version of the software to ensure the error has been resolved.
- **Red Flow (Reopened):** If validation fails (*the error persists or a new one was created*), the bug returns to the development stage to be fixed again.
- **Green Flow (Closed):** If validation is successful, the bug is marked as resolved and formally closed.

Severities

- **Critical:** Blocks progress or crashes the game.
 - **Example:** The game crashes unexpectedly while launching or during gameplay, or there is a bug that completely prevents moving to the next level.
- **High:** Main functionality is broken, but it does not block overall progress.
 - **Example:** The "Buy" button in the shop doesn't work, or the character is unable to jump, even though you can still move around the map.
- **Medium:** Incorrect behavior that is non-critical.
 - **Example:** The character clips through a wall when performing a specific move, or a side quest fails to give the promised reward, while the rest of the game functions correctly.
- **Low:** Visual details, text, or minor improvements.
 - **Example:** A typo in the dialogue, a button that is slightly misaligned, or a texture that appears a bit blurry.

Bug Report/Defect Report

These bug reports/defect reports will be published on Notion. [Click here.](#)

Bug Summary (Descriptive Title)

Example: [Settings] Volume changes are not saved after applying.

General Information:

- **Assignee:** @name
- **Severity:** [Critical / High / Medium / Low]
- **Status:** [New / In Progress / Fixed / Re-test]
- **Date:** Open - MM/DD/YYYY Close - MM/DD/YYYY

Steps to Reproduce:

1. **Launch** the game.
2. **Navigate** to the Settings menu.
3. **Adjust** the volume slider (increase/decrease).
4. **Click** on "Apply" or "Save Changes."

Expected Result:

The volume settings should be saved correctly and persist after leaving the menu.

Actual Result:

The volume changes are not saved and revert to their previous state immediately after applying.

Attachments / Evidence: (Please attach screenshots or video links to ensure an accurate reproduction of the bug).

Attachments / Evidence:

(Attach screenshots, GIFs, or video links here to demonstrate the bug).

Comments:

(Add any additional notes, hardware specs, or specific conditions where the bug occurs).

Testing templates

Templates can be found by clicking on '[Testing Templates](#)' to create your Test Cases, Data Validation, and Checklists.

Test Execution Statuses

Test Execution Status: [Color-Coded Reference Guide](#)

- **Pending**
 - **Reason:** The test is in the queue but has not started yet. It may be waiting for a specific build or environment setup.
 - **Action:** Monitor the project timeline and begin execution once the prerequisites are met.
- **In Progress**
 - **Reason:** The QA analyst is currently executing the test steps and gathering evidence.
 - **Action:** Continue testing until a definitive result (Passed, Failed, or Blocked) is reached.
- **Passed**
 - **Reason:** The actual behavior of the software matches the expected result perfectly.
 - **Action:** No further action required. Attach evidence (screenshots/logs) and close the test case.
- **Failed**
 - **Reason:** A discrepancy or error was found; the system does not behave as described in the documentation.
 - **Action:** Log a new Bug Report immediately. Link the bug to this test case and assign it to the development team.
- **Re-test**
 - **Reason:** A previously failed bug has been marked as "Fixed" by a developer and needs to be verified.
 - **Action:** Run the test steps again to confirm the fix and ensure no new issues (regressions) were introduced.
- **Blocked**
 - **Reason:** A critical issue or an external factor (like a server outage or a different bug) prevents the tester from even reaching the functionality.

- **Action:** Notify the team about the "Blocker." The test cannot proceed until the underlying issue is resolved.
- **Skipped**
 - **Reason:** The test was intentionally not performed because the feature was removed, changed, or is currently out of scope.
 - **Action:** Document the specific reason why the test was bypassed to maintain a clear audit trail.

QA Tech Stack & Tools

- **Notion**

Used for process documentation, guides, internal linking, bug reporting, and the QA Wiki. Access is granted to all Core QA Team members.

- **Google Drive**

Storage for high-capacity files: bug recordings, screenshots, exported documents, test cases, validation sheets, and checklists.

- **Discord**

Dedicated to direct communication and community engagement. Since Community Testers do not have access to Notion, they will submit their reports through this platform.

- **Microsoft Excel**

Utilized for managing test cases, validation tables, and checklists. These files are synced with Notion as needed and backed up on Google Drive.

- **Video Capture (*Vimeo/Game Bar*)**

Tools for capturing bug reproduction. Use Windows Game Bar (*Win+G*) for quick clips; use Vimeo for longer videos that require controlled or restricted access.

Core QA Team Responsibilities

- **Technical Documentation Design:** Create and maintain test cases, data validation matrices, checklists, and detailed bug reports.
- **Test Execution:** Perform thorough manual testing and accurately document the results obtained.
- **Bug Management in Notion:** Report incidents in Notion ensuring clear reproduction steps, severity assignment, and attachment of evidence (*photos/videos*).
- **Defect Lifecycle:** Verify fixes in each new build and update ticket statuses accordingly.

- **Data Validation:** Evaluate data entries based on equivalence classes and boundary values defined for the system.
- **Channel Monitoring:** Stay up to date with announcement channels on Discord and Notion to apply updates to manuals or new information.
- **Non-Disclosure Agreement:** Ensure the security and privacy of information, the workspace, and the provided test builds.
